The *Microcystis* cyanobacteria bloom continues in the western basin along- and offshore the Ohio and Michigan coast from Maumee Bay north past Stony Point. Observed winds last week (7/28-29) caused mixing that reduced surface concentrations from earlier. Measured toxin concentrations are below recreational thresholds throughout the bloom extent.

Forecast winds (2-10kn) today and tomorrow (7/31-8/1) will reduce mixing, increasing the chance of scum formation in the bloom region. Winds will promote the easterly transport of *Microcystis* today through Thursday (7/31-8/3) towards the Bass Islands.

The persistent cyanobacteria bloom of *Planktothrix* continues in Sandusky Bay and extends into Lake Erie.

NOAA’s GLERL provides additional HAB data: https://www.glerl.noaa.gov/res/HABs_and_Hypoxia.
